

# Laserfiche Key Concepts

Before you start using Laserfiche, learn the following key concepts.

Icon	Concept	Description
	Repository	A repository allows information to be organized and accessible from a central location. Your repository contains your documents, the folder structure in which they are contained, and additional information such as metadata, annotations, and security.
	Laserfiche	Laserfiche is a Windows application that allows you to store, organize, and access your organization's information. It consists of the Laserfiche Server, which hosts your information, and the Laserfiche client applications, which allow you to access and work with that information.
	Folder	A folder aids the organization of your documents. Folders can contain Laserfiche imaged documents, electronic documents, shortcuts, and other folders.
	Document	Laserfiche uses the term "document" to refer to an imaged document or an electronic document.
	Imaged Document	When you create a document by scanning or importing pages into the repository, you create an imaged document. Imaged documents can contain search text and metadata, and they open in the Document Viewer.
	Electronic Document	An electronic document is a Laserfiche document associated with an electronic file. An electronic file is any non-image file that was created in an application other than Laserfiche. Electronic documents are usually viewed and modified using an external application. For example, a Word document stored in Laserfiche can be viewed using Microsoft Word. An electronic document can also be opened in the Document Viewer. This allows you to view images, text, and field data associated with it. If it is a PDF, you can also view the PDF file directly within Laserfiche. Laserfiche can associate text with an electronic document by retrieving it directly from the content of certain types of electronic files. You can generate image pages from PDFs in the Client, and you can generate images and text of other electronic document types with the help of Laserfiche Snapshot. By default, the icon for the Windows application associated with an electronic document or electronic file is displayed in the Folder Browser.
	Shortcut	A shortcut allows you to open an item from a location other than where it is stored in the repository. Shortcuts provide quick and convenient access to documents while maintaining the manner in which your documents

		have been organized. In addition to folder shortcuts you may also create shortcuts to documents and electronic documents. The shortcut icons will have arrow in the lower left hand corner.
	Scanning	Laserfiche Scanning is a Laserfiche component that allows you to scan paper documents into your repository.
	Search	You can perform searches to quickly locate entries in Laserfiche. In addition to full-text searches, you can search for nearly any property on the document. Searches allow you to find and work with documents efficiently.
	Metadata	Metadata is a general term used to refer to information associated with a document in Laserfiche. Metadata consists of template and field data, tags, links, version information, and digital signatures.
	Field	A field stores supplemental information on a document or folder. Fields provide a quick overview of the content or important identifying characteristics of a document or folder, and increase the entry's searchability. There are several different types of fields designed for storing different kinds of information, such as text, dates, and numbers. Fields are generally collected into templates for easy management, but can be applied to entries on their own.
	Template	A template is a collection of fields, which can be used to categorize a document for search and retrieval and to quickly apply those fields to the document.
	Tag	A tag is a label applied to a document. A tag may be purely informational (such as a "Review" tag), or it might be a security tag (such as "Classified") that restricts access to the document. A document with a security tag can only be viewed by users who have been granted that tag.
	Link	A link is a connection between multiple documents that allows you to keep track of related items. There are two types of links: document relationships and link groups. A document relationship connects two documents that are associated in a particular way, such as "E-mail" and "Attachment." A link group is a collection of two or more documents that are all related in some way, such as all the documents related to a particular event.
	Version	Documents in the repository can be placed under version control. When a document is under version control, changes to that document will be saved as separate versions within the document. You can then view and manage changes to a document, keep track of edits, compare versions, or revert to another version.

	Digital Signature	A digital signature is a way of indicating that a document is authentic, has been signed by a particular person, and has not been modified since the signature was applied. Digital signatures will only be available in your repository if your Laserfiche Server is licensed for them.
	Annotation	An annotation is additional information applied to a specific page of a document, such as a highlight, a sticky note, or a redaction.
	Text Generation	Text generation is the process of creating searchable text associated with a document. Text can be generated in one of two ways: by performing an Optical Character Recognition (OCR) process on an image containing text, or by extracting text directly from an electronic document (such as a Word document file).
	Volume	Images, text, and electronic files in your repository are stored on the hard drive in volumes. Whenever a new document is added to the repository, it will be stored in one of your volumes.
	User	Laserfiche security revolves around users. Only Laserfiche users and trusted Windows and LDAP accounts can log in to a repository. Once a user logs in, their rights will be limited to those that a Laserfiche administrator has granted to them.
	Group	A group is a collection of users who share a particular role or who will be performing similar actions in the repository. Groups facilitate security administration by allowing a Laserfiche administrator to configure the security for a set of users, instead of having to configure security for each individual user.
	Briefcase	A briefcase is a file containing entries exported from a Laserfiche repository. Documents stored in a briefcase retain their images, text, electronic files, metadata, annotations, and records management information. A folder stored in a briefcase will retain its structure, the manner in which documents were organized is preserved. A briefcase does not store the original security for documents and folders stored in it, so newly imported files may need to have their security access adjusted.
