

The entries are going to be located in a folder inside of LF as this is a migration project

Custom Query to the database to pull back the metadata with each document – there are 18 rows that may or may not have values, but we are pulling them all

When I first tracked tokens, I could see the values, but I couldn't apply them anywhere

Upon looking at the support site, I see that I may need a "for each row activity" in order to have them display and it should be set to "current" – I still believe I'm missing something...
